

Training workshop: “Studying international practices in implementation of innovative energy efficiency technologies in the electric power industry. Methodology, goal and objectives of electricity and heat consumers energy survey”
SEIT building, 62 Bayram Khan str, Mary, 13-18 March 2024

Pilot facility energy survey. Goals, objectives, methods of conducting residential and public buildings energy surveys. Methods of energy survey indicators analysis, energy efficiency feasibility study elaboration

Zhaxylyk Tokayev
International Consultant, SECCA

LEGAL FRAMEWORK

2012

- **Law of the Republic of Kazakhstan “On energy saving and improving energy efficiency”**

2012-2015

- Rules for conducting an energy audit (August 2012)

- Rules for the certification of candidates for energy auditors (November 2015)

- Rules for analyzing the conclusion of an energy audit (November 2015)

KEY ACTORS

**Ministry of Industry and
Construction of the Republic
of Kazakhstan**

**Legal entities -
Customers**

Energy auditors

Training centers

**Electric Power and
Energy Saving Development
Institute (EEDI)**

A LIST OF REQUIREMENTS TO AN ENERGY AUDIT ORGANIZATION

2012

Accreditation requirements for an energy audit organization

- 3 **Staff**
having a degree
in Engineering or related technical sciences
and work experience of at least 3 years

- 1 **Documentation**
Charter or certificates of state. registration

- 2 **MTS***
- for industrial enterprises – 14 items
- buildings and structures – 10 items.

- 4 **Certificates**
of a training course completion

- 5 **Application**

**material and technical support*

Individuals

A total of

361

Requirements for certification (simple notification)

- 3 **Certificate**
of an energy audit course completion

- 1 **Application**

- 2 **Diploma**
In Engineering or related
technical sciences

- 4 **Proof**
Of work experience
(no less than 5 years, including at
least 1 year for an EA organization)

- 5 **Protocol**
testing
knowledge under electrical
safety permit grade III and higher

Legal entities

A total of **204**

Notice of commencement

- 1 **Staff**
at least 4 energy auditors certified by the
authorized body

- 2 **MTS**
Data measuring systems and technical
equipment according to the list approved
by the authorised body

Funded by
the European Union

Requirements for obtaining an energy auditor certificate

A degree in Engineering or related technical sciences

Having a work experience of at least 5 years, of which at least 1 year in an energy audit organization

Retraining and (or) advanced training of personnel carrying out activities in the field of energy efficiency

Electrical safety permit grade III and higher

Electronic Application certified with digital signature

Obtaining an Energy Auditor Certificate in the field of energy saving and energy efficiency improvement

Requirements for Training Centers for retraining and (or) advanced personnel carrying out activities in the field of energy audit and energy efficiency

1

Copies of educational curricula and plans

2

Copies of diplomas of two teachers, including at least 1 with an academic degree of at least a candidate (master) of technical sciences

3

Copies of documents confirming the presence of two teachers on staff

4

Copies of documents confirming ownership of the classroom and computers

5

Copies of documents confirming ownership of classrooms, computers and data measuring systems and technical means

1

Creation of a Commission for Qualification Testing of Knowledge, created annually by order of the head of the energy organization

2

Training Center
Completion of 72-hour electrical safety training

3

Testing (using computer programs or in writing)

4

Protocol for qualification testing of knowledge

5

Assigning an electrical safety permit grade

BODIES FOR CONFIRMATION OF PERSONNEL COMPLIANCE

Existing regulation

Certification by an authorized body

Requirements for issuing a certificate:

- A degree in Engineering and related technical major;
- Courses in energy audit;
- Experience of at least 5 (five) years;
- Test of knowledge for electrical safety permit grade III and higher;
- Recertification every three years.

Proposed regulation

Certification by bodies for confirmation of personnel compliance

Requirements for issuing a certificate:

- A degree in Engineering and related technical major;
- Courses in energy audit;
- Experience of at least 5 (five) years;
- Test of knowledge for electrical safety permit grade III and higher;
- **confirmation of qualification every three years;**
- **theoretical and practical exam.**

Funded by
the European Union

Energy auditor*

An individual who has a certificate of conformity in the field of energy saving and energy efficiency

Certificate of conformity in the field of energy efficiency

A document issued by an accredited body in accordance with the established requirements, certifying the competence of an energy auditor

**The energy auditor carries out his activities only as part of one energy audit organization*

QUALIFICATION REQUIREMENTS according to ST RK 3838-2023

Energy audit. Qualification requirements for an energy auditor

QUALIFICATION REQUIREMENTS

A degree in Engineering or related technical sciences

Work experience (including 1 year in the field of energy efficiency)

Certificate of course completion

Grade of Electric Safety Permit

Experience in conducting energy audits

either

10 entities with buildings, structures and constructions

or

5 industrial entities or those consuming more than 15,000 tons of reference fuel per year

or

5 entities with buildings, structures, constructions and
3 industrial entities or those consuming more than 15,000 tons of reference fuel per year

Funded by
the European Union

List of data measuring systems and technical means necessary to carry out energy audit activities (for buildings only)!!!

#	Device	Note	Application
1	Thermal imager	Used for inspection of building envelopes and engineering systems.	Constantly
2	Hygrometer	In most cases, a thermohygrometer is used to measure air temperature and humidity in rooms. .	
3	Luxmeter	Used to measure the level of illumination indoors and outdoors.	
4	Power quality analyzer	Used to determine power quality parameters and monitor power consumption	
5	Heat meter or heat flow meter	Used to determine the thermal conductivity of building windows. Use for other purposes is limited by the need to prepare measurement sites, which in most cases is not approved by the Customer	Often
6	Laser rangefinder	It is used along with a tape measure to determine the geometric parameters of building envelopes. .	
7	Ultrasonic liquid flow meter	An ultrasonic flow meter is used when it is necessary to determine coolant flow. However, most buildings are equipped with metering devices	Rarely
8	Current clamps	In most cases, a power quality analyzer is used	
9	Anemometer	Inspection of building ventilation systems is practically not carried out due to the significant amount of work involved and the need to create operating modes, which is not approved by the Customer. In modern facilities, where complex HVAC systems are maintained by specialized organizations, all measurements are carried out by them	Not used
10	Non-contact (infrared) thermometer with a measurement range from 0 to 550 0C	When conducting an instrumental inspection of a building, a thermal imager is usually used for these purposes, despite the error in the measurement results.	
11	Thickness gauge (if the flow meter does not have this function)	Not applicable due to the need to prepare measurement sites and, as a result, non-approval of measurements by the Customer, as well as due to the lack of need to determine values.	
12	Contact thermometer	When conducting instrumental inspections of buildings, a thermal imager is usually used for these purposes, despite the error in the measurement results.	
13	Pressure gauges	Not applicable due to the need to prepare measurement sites and, as a result, non-approval of measurements by the Customer, as well as the presence of their own instruments	
14	Gas analyzer	Not applicable due to the lack of survey objects (boiler houses)

FINAL ENERGY CONSUMPTION IN KAZAKHSTAN

ENERGY INTENSITY OF MANUFACTURING INDUSTRY

Of 43 countries in terms of energy intensity per unit of added value of the manufacturing industry, Kazakhstan took 7th place.

ENERGY INTENSITY OF MINING INDUSTRY

Of 42 countries in terms of energy intensity per unit of added value of the mining industry, Kazakhstan took 11th place.

ENERGY INTENSITY OF CHEMICAL INDUSTRY

Of 32 countries in terms of energy intensity per unit of added value of the chemical (including petrochemical) industry, Kazakhstan took 7th place.

ENERGY INTENSITY OF FOOD INDUSTRY

Of 34 countries in terms of energy intensity per unit of added value of the food and tobacco industry, Kazakhstan took 29th place.

ENERGY INTENSITY OF FERROUS METALLURGY

Of 40 countries in terms of energy intensity per unit of physical output of ferrous metallurgy, Kazakhstan took 6th place.

ENERGY INTENSITY OF BASE METALS

Of 32 countries in terms of energy intensity of basic metals per unit of added value, Kazakhstan took 24th place.

* based on the results of
energy audits

FUEL CONSUMPTION BY POWER PLANTS

In 2019, Kazakhstan ranked second among individual countries with its share of coal in fuel consumption for heat and power production of 74% in 2019, after China, which had a 78% share of coal. Countries where natural gas had a significant share of total fuel supplies for power and heat production included Belarus (90%), Russia (58%), and the UK (40%).

ENERGY SECTOR EFFICIENCY

In Kazakhstan, energy sector efficiency in 2019 was 57%. The relatively low efficiency of the energy sector (57%) in Kazakhstan can be explained by energy losses during transformation (due to the high share of coal for electricity and heat production), energy losses during transportation and distribution, and the high level of own use in the energy industry.
